Hotel Guest WiFi

UBERCORE®

Overview

In hospitality industry, the base of the business is the customer experience. And these days, Internet has become not an optional thing. People are searching for hotels having availability of WiFi.

Study shows that hotels having WiFi attract more than 2x customers as compared to hotels having no WiFi.

Many existing hotel WiFi setups use home grade wireless routers placed randomly with a common password. Guests are given the password to access the Internet.

Problems with the old setup:
- ✗ SLOW Internet
- ✗ NO uniform WiFi coverage
- ✗ NO speed control
- ✗ NO reliable connectivity
- ✗ NO centralized control
- ✗ DIFFICULT to maintain

Ubercore can help to design and deploy a complete hotel WiFi solution in a very cost effective way.

Challenge

Typical hotel layouts have guest rooms on the either sides of a common corridor in a multi-story building.

WiFi depends on lots of factors like the materials used in the construction walls, thickness of the walls, reflective surfaces etc.

Key Challenges:
1. Complete WiFi signal coverage
2. Running cables to connect all access points
3. Controlled guest Internet access
4. Reliable Internet for all

Solution

Wireless cloud routers

Ubercore specializes in design and deployment of wireless controller based cloud routers. These routers are first simulated using the blueprint of the building with our simulation software. After ensuring proper signal coverage in the software, we deploy them in the building.

Deployment of cables

Cables are optimally laid out by our professionals. One can use your own electrician to lay out networking cables as per our instructions.

Wireless cloud controller

All the cloud wireless routers are controlled and monitored by our secure and private cloud controller. These wireless cloud controllers are hosted in Ubercore cloud.

Token based guest login

Guests are allowed using time based tokens, which will expire after some predefined time. These tokens will be unique and can only be used once. Facebook login or mobile based logins can also be used.

Benefits

✔ Ensured maximum WiFi coverage
✔ Secured guest login
✔ No unwanted access by previous guests
✔ No need to change WiFi passwords on routers
✔ Easy to maintain
✔ 24x7 monitored by Ubercore cloud
