# Hosting and Virtual Private Servers

UBERCORE®

## Overview

One of our client which is a premier engineering institution in the north Karnataka region asked us for a solution to host multiple web-apps in a cost effective way. They also needed custom domain based emails with spam and antivirus protection.

In the past they have hosted their websites on various well known hosting providers. Global hosting providers provide reasonable hosting but they are not cost effective for hosting multiple websites.

Reasons for migration:

✗ NOT cost effective
✗ NO customized solutions
✗ HIGH costs

## Challenge

When the requirements are so diverse, we needed to be very flexible and agile. It was a challenge to move multiple apps within a very short time.

**Key Challenges:**
1. Multi platform servers
2. Different software dependencies
3. Resource intensive
4. Short deadline

## Solution

**Custom Virtual Private Server**
We have created a specialized VPS to fulfill the needs of our client. All the middlewares were installed and configured to suit the needs of the project.

**Web application firewall and DDOS protection**
Our servers are protected with 3 layered firewall system. Hardware firewalls, software firewalls and application specific firewalls.

**Domain based emails**

  Most often domain based emails are easy to setup. But, as our client domain was allocated by the National Informatics Center, we had to collaborate with them to get it done.

## <u>Benefits</u>

- ✔ Cost effective
- ✔ Customized solutions
- ✔ Secure servers
- ✔ Low latency
- ✔ 99.9% uptime
